

How to use the down-the-hole drilling rig lifting pad

How does a down-the-hole hammer drill work?

The down-the-hole hammer drilling process begins with the hammer being located behind the drill bit, which is then connected to the end of the drill string. When activated, the piston strikes the back of the drill bit, creating powerful blows that break apart rock formations.

How can a drill rig prevent injury?

The use of proper equipment to lift pipe, for example, is key to avoiding an injury." It is critical that drill rigs sit on stable ground, where they can't sink or tip over, and are properly secured to prevent movement.

How does a rock drill work?

The front end is directly connected to the drill bit and the back end is connected to the drill rod. When rock drilling, the impactor dives into the hole, and the piston (hammer) in the impactor reciprocates to strike the shank through the gas distribution device (valve) so that the drill bit impacts the rock at the bottom of the hole.

What makes a good drill rig?

It is critical that drill rigs sit on stable ground, where they can't sink or tip over, and are properly secured to prevent movement. Stability can be affected by factors such as the grading, ground conditions, and size and surrounding limiting factors of the drill pad. "The size of equipment dictates a minimum drill pad size.

What is a down the hole hammer?

One of the most commonly used tools in the drilling industry to meet such challenging scenarios is the Down the Hole Hammer (DTH hammer). DTH hammers are most used in hard rock formations and are designed to tackle complex tasks like drilling in populated areas without putting existing structures at risk.

Why is down-the-hole hammer drilling a good choice?

Additionally, it provides better hole quality and requires less energy, making it a cost-effective and efficient choice for various drilling projects. Down-the-hole hammer drilling is commonly used in mining, construction, geothermal exploration, and water well drilling due to its ability to efficiently penetrate hard rock formations.
